- Explore this dataset. What do you think is different to these data as compared to a bulk RNA-seq dataset?
- Try visualizing the structure of this dataset using tools we have worked with before. For example, make a PCA and MDS plot. You can color the cells according to the cluster labels in the `colData`.
- Try visualizing the structure of this dataset using any tool you want.

After trying:

Are you able to recapitulate the structure (e.g., cell type clusters)? What are the issues you are encountering, and **why** do you think these are happening?
